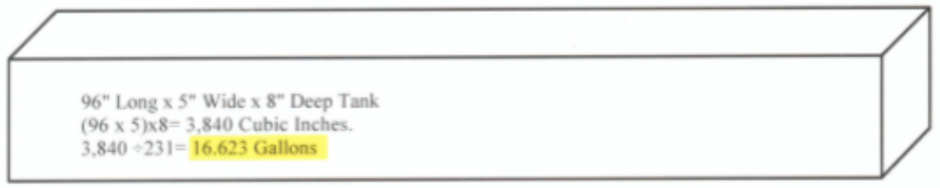
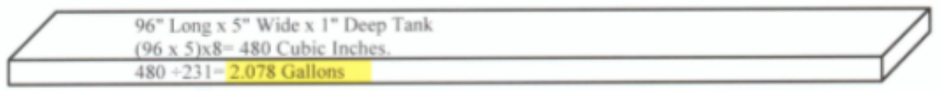
LET'S TIE IT ALL TOGETHER AND PUT IT TO USE.

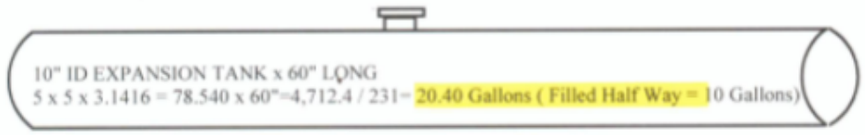


96" Long x 5" Wide x 8" Deep Tank
(96 x 5)x8= 3,840 Cubic Inches.
3,840 ÷231= 16.623 Gallons

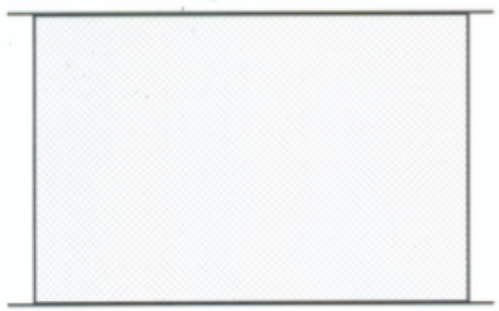


96" Long x 5" Wide x 1" Deep Tank
(96 x 5)x8= 480 Cubic Inches.
480 ÷231= 2.078 Gallons

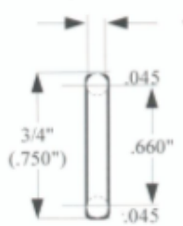
96" Long x 5" Wide x 8" Deep Tank
(96 x 5)x8= 3,840 Cubic Inches.
3,840 ÷231= 16.623 Gallons



10" ID EXPANSION TANK x 60" LONG
5 x 5 x 3.1416 = 78.540 x 60"=4,712.4 / 231= 20.40 Gallons (Filled Half Way = 10 Gallons)



Radiator has 4 cores.
Each Core is 48" Tall x 45" Wide x 4-5/8" Deep
Has 6 rows of 3/4" Tubes on 5/8" Centers
So 45 ÷ .625 = 72 Tubes per Row
72 Tubes x 6 Rows = 432 Tubes
432 Tubes x 48" Long = 20,736" of tubes per core



.045 x .045 = .002025
.002025 x 3.1416=.006362

.090" x .660" = .0594

.006362 ÷ .0594 = .065762 Square Inches

.065762 Square Inches x 48" Tall Tubes=3.157 Cubic Inches

3.157 Cubic Inches x 432 Tubes= 1364 Cubic Inches on ID's of tubes per core.

4 Cores x 1364 Cubic Inches = 5,456 Cubic inches total ÷ 231 = 23.619 Gallons

16.623 + 2.078 + 16.623 + 10 + 23.619 + 73.439 = 142 Gallons

Max. heat exchanger raw water press.—psi (kPa)	65
Generator heat radiated to room @ Rated BHP—Btu/min (W)†	728
Air required to radiator—cfm (m^3/min)††	14500
Static pressure for air flow—in H_2O (kPa)	1.0

285 HP/ 200 kW at 1800 RPM
Jacket water flow 110 GPM
Jacket water temp 170-185F
Heat Rejection 9690 BTU/ MIN

Water weighs 8.34 pounds/ gal
1 Btu is heat to raise 1 LB water
1 Degree F.

110 Gallons x 8.34 = 917.4 LB.
9690 btu/min / 917.4 LB Water
= 10.56 Degree F.

So at Full Load if the water goes Into the radiator at 180F and Comes out 10.56F cooler the Radiator is working "Good Enough".

The mechanic said 14 degree F cooler.

917.4 x 14 = 12,843.6 BTU's.

		85.0)

Spec sheet says 9690 with
A water cooled exhaust manifold!

Not the radiators problem. Perhaps something mechanical.

1 foot of head = .433 PSI

Pressure Head Measurement of water pressure based on the water depth. Measurement is stated as "feet of head" or "meters of head". One foot of head is the pressure at the bottom of a 1 foot high column of water, which is also equal to 0.433 PSI. So it's really a measure of the weight of water of a given depth. It doesn't matter how much water is present, the pressure head is only determined by the depth of the water. The water pressure at the bottom of a 2" diameter, 20 foot tall water filled pipe is the same as the water pressure at the bottom of a 20 foot deep lake. (No joke, it's true!)
